

Notes to self

- . When you define a property, Qt automatically sets up a signal that's fired everytime something changes about the property
- . The signal is named on[Propertyname with first leter capitalized]changed
- . Show the signal for existing properties in the app like width and height.

Property Handlers

Property Handlers

```
Window {
    id : rootId
    title: qsTr("Properties and Handlers Demo")

    property string firstName: "Daniel"
    onFirstNameChanged: {
        console.log("The firstname changed to :" + firstName)
    }
    onTitleChanged: {
        console.log("The new title is : " + rootId.title)
    }
    Rectangle {
        MouseArea{
            anchors.fill: parent
            onClicked: {
                firstName = "John"
                rootId.title = "The sky is blue"
            }
        }
    }
}
```
