

Notes to self

- . Showing that you can only anchor to parent or sibling items.
- . We try to anchor topLeftRectId to siblingRect but that won't work :

```
Rectangle {  
    id : topLeftRectId  
    width: 100  
    height: width  
    color: "magenta"  
  
    //This anchor won't work because siblingRect isn't either a  
    //sibling or a parent  
    anchors.top: siblingRect.bottom  
}
```

Anchors : Parents and Siblings

```

Window {
    Rectangle {
        id : containerRectId
        width: 300
        height: width
        border.color: "black"
        anchors.centerIn: parent

        Rectangle {
            id : topLeftRectId
            width: 100
            height: width
            color: "magenta"

            //This anchor won't work because siblingRect isn't either a sibling or a parent
            //anchors.top: siblingRect.bottom
        }
    }

    Rectangle {
        id : siblingRect
        width: 200
        height: 200
        color : "black"
        anchors.right: containerRectId.left
    }
}

```
