

Notes to self

- . Exploring QTextEdit
- . Component to show multiple lines of editable text
- . Steal the QTextEdit code from the docs and use that as a starting point
- . Run without using rich text and show the effect
- . Run using rich text and show how the html tags are shown
- . Center the QTextEdit
- . Show that you can delete and type text
- . Try to type text across multiple lines
- . Show a long piece of text : the text below
- . The QTextEdit will try to show that on one line
- . Use the wrap property to make it wrap text to new lines
- . We can't see all the text
- . There are ways one can make the text scrollable but there are better tools like QTextArea that make these this easier so we'll just stop here for QTextEdit.

TextEdit

TextEdit

```
TextEdit {  
    id : textInputId  
    width: 240  
    text: "<strong>Because</strong> ..."  
    wrapMode: TextEdit.Wrap  
    textFormat: TextEdit.RichText  
    font.family: "Helvetica"  
    font.pointSize: 20  
    color: "blue"  
    focus: true  
    onEditingFinished: {  
        console.log("The current text is :"+ text)  
    }  
}
```
