

Notes to self

- . Exploring TextArea
 - . Start out with a raw TextArea without a scrollView
 - . Wrap in a scrollView to add some scrolling
 - . ScrollView has some binding loops problems especially when you try to use that in conjunction with TextArea, example below :
QML ScrollView: Binding loop detected for property "rightPadding"
 - . I haven't cared enough to dig more into this, but if it is for your project, you may research more on this.LEAVING THIS FOR NOW.

Page and TabBar

TextArea and ScrollView

```
ScrollView{
    id : scrollView
    width: 600
    height: 150
    TextArea {
        id : textAreaId
        background: Rectangle{
            width: parent.width
            height: parent.height
            color : "black"
        }
        color: "white"
        wrapMode: TextArea.WordWrap
        placeholderText: "Type in your query"
        //text: "... long text"
    }
}
```

CMake

```
find_package(Qt6 6.2 COMPONENTS Quick QuickControls2 REQUIRED)
...
target_link_libraries(app2-Button
    PRIVATE Qt6::Quick Qt6::QuickControls2)
```
